Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

A restriction fragment of the insert of M.gallisepticum genomic clone pUM -67 containing an open reading frame was sequenced (AAQ77857). The ORF encodes an antigenic polypeptide. A recombinant avipox virus comprising the coding sequence can be used as a live vaccine to protect against infection by Mycoplasma gallisepticum. (Updated on 25-MAR-2003 to correct PN field.)

                                                                          ద
                                                                                                           ઠે
                                                             40kD antigen of Mycoplasma gallsepticum under the control of a synthetic promoter. A 1300 bp restriction fragment containing the promoter-ORF sequence was excised and was used in the construction of plasmid pNZ7929-R2. This in turn was involved in the construction of a recombinant avipox virus vector comprising the TTM-1 gene, DNA encoding the signal membrane and FPV sequences. The recombinant avipox virus haemagglutinin neuraminidase and FPV sequences. The recombinant avipox virus is useful as a live (Updated on 25-WAR-2003 to correct PN field.)

                                                                                                                                                                                                                                                                                                               The sequence coding for the 40kDa antigen was obtained by PCR amplification of M.gallisepticum genomic DNA. The antigen reacts with Mycoplasma-immune or Mycoplasma-infected serum and can be used as a vaccine to protect fowl from M.gallisepticum infection. (Updated on 25-MAR-2003 to correct PN field.)

Ohsawa I, Funato H, Iritani Y;

A restriction fragment of the insert of M.gallisepticum genomic clone pUM -66 containing an open reading frame was sequenced (AAQ77856). The ORF encodes an antigenic polypeptide. A recombinant avipox virus comprising the coding sequence can be used as a live vaccine to protect against infection by Mycoplasma gallisepticum. (Updated on 25-MAR-2003 to correct PN field.)

Claim 9; Page 30; 70pp; English

The present invention describes a DNA molecule derived from a prokaryotic cell, where at least one of the DNA regions encoding NXB (where N = asparagine, X = any amino acid other than proline, and B = serine or threonine) has been modified so that no N-glycosylation occurs during the expression in a eukaryotic cell. Also described; (1) a fused DNA molecule, where a DNA encoding a signal sequence has been ligated to the N-terminal end of the modified DNA molecule as described above so that it may be expressed as a fusion protein; (2) a recombinant virus integrated with the DNA molecule or the fused DNA molecule described above; (3) producing a modified or fusion protein by using the recombinant virus described above, to express a protein encoded by the modified DNA molecule in a eukaryotic cell; and (4) a vaccine comprising the recombinant virus. The DNA molecule has virucide and immunostimulant activities. The DNA molecule has virucide and annunostimulant activities. The DNA molecule is useful for producing a vaccine for treating viral infections. The present sequence is used in the exemplification of the present invention

                                                                                                                                                                                                                                        397
                                                                                                                                                                                                                                                                                                  457
This sequence encodes the chimeric protein 40 K-S which comprises a fragment of the Marek's disease virus outer membrane protein gB fused to an artigenic protein from Mycoplasma gallisepticum. The chimeric protein can be used in recombinant live vaccines for prevention of infection by Mycoplasma gallisepticum, especially as the outer membrane protein shows antigenicity in poultry

The chimeric protein can be used in recombinant live vaccines for prevention of infection by Mycoplasma gallisepticum, especially as the outer membrane protein shows antigenicity in poultry

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This is the nucleotide sequence of a fragment of the Mycoplasma gallisepticum genome which codes for a 261 amino acid protein. This sequence and the sequence of AATO4075 (encoding a 661 amino acid protein) can be used to detect M:gallisepticum using probes based on nucleotides 1125-1648 and primers based on nucleotides 449-466, the complement of AATO4075, and a probe based on nucleotides 718-41 of this sequence. The method using these sequences is faster i.e. is able to detect non wild have a vian chronic respiratory diseases, within one day, from avian secretions, washings from the lung, respiratory tract, nasal cavity, etc
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 60

The present invention describes a DNA molecule derived from a prokaryotic cell, where at least one of the DNA regions encoding NXB (where N = asparagine, X = any amino acid other than proline, and B = serine or threonine) has been modified so that no N-glycosylation occurs during the expression in a eukaryotic cell. Also described: (1) a fused DNA molecule, where a DNA encoding a signal sequence has been ligated to the N-terminal end of the modified DNA molecule as described above so that it may be expressed as a fusion protein; (2) a recombinant virus integrated with the DNA molecule or the fused DNA molecule described above; (3) producing a modified or fusion protein by using the recombinant virus calculated by the modified DNA molecule or the fused DNA molecule in a eukaryotic cell; and (4) a vaccine comprising the recombinant virus. The DNA molecule has virucide a vaccine for treating viral infections. The DNA molecule is useful for producing a vaccine for treating viral infections. The present sequence is used in the exemplification of the present invention AATATCCAGAATACGTTATCAACTATTAATGAACAAAAGACTAATGCTGATGCATTATCT 480 CAAATTCGCAATAATTTAGTGGATCTATACAATAAAGCTAGTAGTTTAATAACTAAAACA 360 DNA molecule derived from a prokaryotic cell, useful for producing a vaccine for treating viral infections comprises at least one modified DNA regions encoding NXB so that no N-glycosylation occurs during expression. When inserted into a recombinant vector used to transform a host the antigen protein produced can be used as a vaccine to prevent and diagnose MG infection.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The DNA can be inserted into an expression vector for the prodn. of polypeptide which elicits an antigen-antibody reaction with anti-mycoplasma gallisepticum poultry sera. It may also be ligated to other DNA to produce fusion proceins with an N-terminal bacterial enzyme sequence. See also AAQ04687 and AAQ05649-53. (Updated on 10-MAR-2003 to add missing OS field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This is the nucleotide sequence of a fragment of the Mycoplasma gallisepticum genome which codes for a 661 amino acid protein. This sequence and the sequence of AATO4076 (encoding a 261 amino acid protein) can be used to detect M.gallisepticum using probes based on nucleotides 1125-1648 and primers based on nucleotides 449-466, the complement of bases 893-919, 1908-1934 and the complement of bases 2184-2210 of this
